

## General Evidence

Citation	Design/Method Sample/Setting	Variables and Intervention	Outcome Measures	Results/Analysis	Limitations	Quality and Nursing Implications
<p>Pohlmann, P.R., Graham, D., Wu, T., Ottaviano, Y., Mohebtash, M., Kurian, S., . . . Swain, S. M. (2022). HALT-D: a randomized open-label phase II study of crofelemer for the prevention of chemotherapy-induced diarrhea in patients with HER2-positive breast cancer receiving trastuzumab, pertuzumab, and a taxane. <i>Breast Cancer Research and Treatment</i>, 196(3), 571–581. <a href="https://doi.org/10.1007/s10549-022-06743-9">https://doi.org/10.1007/s10549-022-06743-9</a></p>	<p><b>Design:</b> Randomized double-blind controlled trial</p> <p><b>Method:</b> Crofelemer 125 mg delayed-release tablets orally twice daily during cycles 1 and 2 of chemotherapy</p> <p><b>Sample:</b> 51 patients with HER-2 positive breast cancer receiving taxane therapy with or without carboplatin and trastuzumab and pertuzumab or taxane therapy with trastuzumab and pertuzumab (TCHP/THP chemotherapy regimen (docetaxel or paclitaxel); 26 in the intervention group and 25 in the control group.</p> <p><b>Setting:</b> Not specified</p>	<p><b>Independent Variable(s):</b> Crofelemer</p> <p><b>Dependent Variable(s):</b> Diarrhea, rescue medication use for diarrhea, QoL</p> <p><b>Intervention:</b> Patients who received chemotherapy/HER2-targeted therapy were randomized to crofelemer 125 mg orally twice daily during the first 2 cycles. For the 3rd cycle and subsequent cycles, standard treatment was administered for both groups.</p>	<p>Grade of diarrhea using Common Terminology Criteria for Adverse Events, version 4.0</p> <p>Rescue medication diary used to measure use of standard-of-care breakthrough antidiarrheals</p> <p>Bowel movement diary: used to measure consistency of stool using the Bristol Stool Form Scale,</p> <p>Time to onset and length of diarrhea episodes</p> <p>Functional Assessment of Chronic Illness Therapy for Patients with Diarrhea (FACIT-D) was used to measure patient quality-of-life.</p>	<p>During cycle 1, 68% of patients in the crofelemer arm and 69.6 % of patients in the control arm had diarrhea. During Cycle 2, 65.2% of patients in the crofelemer arm and 72.2% of patients in the control arm had diarrhea. Results were not statistically different, <math>p = 0.074</math>.</p> <p>During cycle 2, no patients receiving crofelemer reported grade 3-4 diarrhea compared to 17.3% in control arm, (<math>p=0.0196</math>).</p> <p>Patients receiving crofelemer also experienced less watery diarrhea in cycle 1 (odds ratio [OR] = 0.77, 95% CI, [0.6129, 0.9774]; <math>p = 0.03</math>) and were 1.8 times as likely to have their diarrhea resolve in cycle 2 (OR = 1.804, 95% CI [1.02, 3.189]; <math>p = 0.0425</math>).</p> <p>Adverse events were similar in both the crofelemer and control groups and included fatigue, nausea, anorexia, mucositis, and constipation.</p> <p>One serious AE in the crofelemer arm (grade 4 neutropenia) was attributed to chemotherapy.</p>	<p>Small sample size</p> <p>Possible variability in patient-reported outcomes</p> <p>Narrow population may limit generalizability of findings.</p>	<p>Crofelemer may be a useful prophylactic intervention to reduce grade 2 or greater chemotherapy-induced diarrhea in patients with HER-2 positive breast cancer receiving TCHP or THP (docetaxel or paclitaxel). This study was limited by a small sample size, and only some of the secondary endpoints were met. Further larger studies are needed to validate these findings.</p>
